AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

Claims 1 to 9. (Canceled).

10. (New) A drive, comprising:

an electromotor;

an output stage, supply lines of the output stage connected to the electromotor; and

a brake supplied from a brake control connected to the supply lines by at least one capacitor.

- 11. (New) The drive according to claim 10, wherein the output stage includes at least one of (a) a converter, (b) an inverter and (c) a power converter.
- 12. (New) The drive according to claim 10, wherein the output stage operable in a pulse-width-modulated manner.
- 13. (New) The drive according to claim 10, wherein the brake is activatable in accordance with a long-lasting occurrence of at least one of (a) a DC voltage or (b) a zero voltage on the supply lines.
- 14. (New) The drive according to claim 10, wherein the brake is configured to transmit brake torque to at least one of (a) a rotor shaft of the electromotor and (b) a shaft connected to the rotor shaft in accordance with a long-lasting occurrence of at least one of (a) a DC voltage or (b) a zero voltage on the supply lines.
- 15. (New) The drive according to claim 10, wherein the brake is activatable in accordance with a critical minimum frequency of respective time characteristics of potentials of the supply lines being undershot.

NY01 1234252

- 16. (New) The drive according to claim 10, wherein the brake is configured to transmit brake torque to at least one of (a) a rotor shaft of the electromotor and (b) a shaft connected to the rotor shaft in accordance with a critical minimum frequency of respective time characteristics of potentials of the supply lines being undershot.
- 17. (New) The drive according to claim 10, wherein the brake is activatable in accordance with critical RMS values of potentials of the supply lines being undershot.
- 18. (New) The drive according to claim 10, wherein the brake is configured to transmit brake torque to at least one of (a) a rotor shaft of the electromotor and (b) a shaft connected to the rotor shaft in accordance with critical RMS values of potentials of the supply lines being undershot.
- 19. (New) The drive according to claim 10, wherein the brake includes a brake coil having one of (a) a one-part and (b) a two-part configuration.
- 20. (New) The drive according to claim 10, wherein the brake control is connected to the supply lines by three capacitors in a three-phase supply.
- 21. (New) The drive according to claim 10, wherein the brake control is connected to the supply lines by two capacitors in a two-phase supply.
- 22. (New) An electromagnetically actuable brake for an electromotor, the electromotor connected to an output stage by supply lines, the brake supplied from a brake control, the brake control connected to the supply lines by at least one capacitor..
- 23. (New) The brake according to claim 22, wherein the output stage includes at least one of (a) a converter, (b) an inverter and (c) a power converter.
